

Demo presentation script

A run sheet for presenting the dashboard on seeded demo data. Read the prep section the day before; the numbered beats are what you say and click on the day.

Before the room

1. Pick a throwaway organization. Never seed a customer's org. Create one through normal signup so onboarding seeds its modules, fields and kanban stages first — the demo seeder needs those to exist.
2. Note the organization id from the URL: /<organizationId>/master-list.
3. Make sure at least one member has the liaison role. Records are assigned to liaisons, and every per-liaison report groups by that. With no liaison the seeder falls back to any member and the liaison charts look empty.
4. Seed:

```
`bash
pnpm --filter api seed:demo -- --org=<organizationId>
`
```

Re-running adds more. To start clean:

```
`bash
pnpm --filter api seed:demo -- --org=<organizationId> --wipe
`
```

--wipe deletes every lead and referral in that org. Check the id twice.

5. Restart the API if you have changed code since it started, then hard refresh the browser.
6. Rehearse once, end to end. The data is deterministic, so what you see in the rehearsal is what you get on the day.

What you get: 40 facilities, 320 referrals linked to them, roughly 4,000 field values and 180 visit logs, spread across the last eleven months and weighted toward recent weeks so the trends slope.

The run sheet

1. Master Marketing List — "this is the book of business"

Open Master Marketing List.

- Point at the stat strip: total facilities, active partners, counties covered.
- Scroll the table. Note that columns are the organization's own — beds, county, psychiatric services — not a fixed schema.
- Click a cell and edit it inline. Say: every change is written to history with who and when.

Say: "Every facility you market to lives here, with whatever fields your

team actually tracks."*

2. Add a facility — "and it stops you duplicating"

Click Create Facilities. Type a name close to one already in the list, for example Cedar Ridge Nursing and Rehab.

- The duplicate dialog appears and names the record it matched.
- Point out that an exact repeat is refused outright, and a near match too.

Say: *"Duplicate facilities are how a referral history gets split in half.

It is checked on create, on rename and on import."*

If it does not fire, the API is running an older build. Restart it.

3. Analyze a facility — "what have we actually done here?"

From the list, open Analyze on one of the first few facilities — those carry the most volume.

- Referrals sent, referrals per week, tier.
- Touchpoints by type, stakeholders, the visit history behind it.

Say: "This is the answer to 'is this relationship worth the drive'."

4. Referral list — "the pipeline"

Open the referral list.

- Filter to Pending.
- Open one record and walk the fields: payor, admission type, assessor.
- Show the kanban view if the audience is operational rather than executive.

5. Analytics — "the part leadership asks for"

Open Analytics.

- Top facilities — a handful of sources carry most of the volume.
- Referral source scorecard — per facility: count, per week, tier.
- Conversion and denial reasons — roughly a fifth of the seeded referrals are rejected, each with a reason, so this is populated.
- County heat map — geography of the book.
- Payer mix.

Say: *"None of this is a separate report anyone maintains. It is the same records your liaisons are already filling in."*

6. Import — "you are not typing your list in again"

Open the import flow with a small spreadsheet.

- Map the columns.
- Point out that duplicates against the board and inside the file are both skipped, and that the count comes back when the job finishes.

7. Compliance, if the audience is clinical or legal

Open Compliance.

- HIPAA mode, the BAA, IP allowlist, retention.
- If HIPAA mode is on and the account lacks a second factor, the readiness gate appears with both steps. That is worth showing deliberately rather than hitting it by accident.

Say: `"PHI columns are encrypted at rest, access is logged, and the second factor is enforced rather than suggested."`

Questions you will get

"Can we use our own fields?" Yes — columns are per organization and added in the app, not by us.

"Where does the data live?" Postgres, encrypted at rest for PHI columns, scoped per organization on every query.

"Can we import from our current system?" CSV or spreadsheet, with duplicate detection on the way in.

"What if two people edit the same record?" Last write wins, and history shows both.

"How do we pay?" Self-serve by card, or a negotiated contract invoiced per period. Contracts are set up by us and paid from the billing page.

If something goes wrong

Symptom	Cause	Fix
Empty analytics	Referrals not linked to facilities	Re-run the seeder; it writes the links
Duplicate dialog never appears	API running a stale build	<code>rm -rf apps/api/dist</code> and <code>pnpm dev:api</code>
Liaison charts empty	No member holds the liaison role	Set one, re-run with <code>--wipe</code>
Seeder exits on fields	Onboarding never ran for that org	Use an org created through signup
Numbers changed since rehearsal	Seeder run more than once	<code>--wipe</code> and seed again

Do not

- Seed a customer organization.
- Run `--wipe` without reading the org id aloud first.
- Demo on the same org someone else is testing on.
